

reminder: those results are time survived (sec) , NOT DPS!

hello! im [Skyon](#) and im showing list of duration unit survived from turret.

how analyze is done:

1. All results are used by world processors.
- 2.Distance of turret is 4 in 1v1 , 10 in 5v5 unless closer distance which marked (5 dis)
3. before analyze starts , inf hp unit spawn to warm up turret and prepare there aiming after cooldown.
- 4.As soon as actual unit spawns , turret starts shooting and timer starts.
- 5.Units stay in center of area and last unit will be knockback resistance.
- 6.Once all same unit type died , timer stop.
- 7.If unit survived more than 120s , logic will predict how long it would takes to kill and mark $\approx$ next to duration value.
- 8.If unit can't hurt unit (such as titan vs avert) , result is marks as N.
- 9.serpulo: if unit hp is almot max after timeout (120s) , it marks as $\approx$ MaxHp.
- 10.if logic predict is longer than 10000s , it marks as $\approx$ T.
- 11.serpulo: for avarage calculation , $\approx$ T and $\approx$ MaxHp are considered 10000s and N is ignored.
- 12.serpulo: for 1v1 , it uses tsunami but in 5v5 , world processor gives status to all units. unless marked turret type (5 wave for example)
- 13.serpulo: nfb means no fire-rate boost. meaning "no overdrive , no liquid for turret boost" unless required (meltdown for example).

157.4 v8

issues:

- time may inaccurate such as ± 0.5 , ± 1 , etc.
- because turret reaction, accuracy aim , etc...
- if air unit falling but still alive , timer won't stop until air hit ground.
- prediction logic is NOT accurate. even more if slow fire rate (scathe).
- serpulo:oil tsunami/status will not be added.
- because number of oil tsunami matters a lot!
